Lecture 1 MATLAB Fundamentals: Features, Syntaxes, Concepts

Matthew J. Zahr

CME 292 Advanced MATLAB for Scientific Computing Stanford University

23rd September 2014

1 Logistics

2 Data Types

- Numeric Arrays
- Cells & Cell Arrays
- Struct & Struct Arrays
- Function Handles

3 Functions and Scripts

- Function Types
- Workspace Control
- Inputs/Outputs
- Publish

4 MATLAB Tools

5 Code Performance

Data Types Functions and Scripts MATLAB Tools Code Performance

Outline

1 Logistics

2 Data Types

- Numeric Arrays
- Cells & Cell Arrays
- Struct & Struct Arrays
- Function Handles

3 Functions and Scripts

- Function Types
- Workspace Control
- Inputs/Outputs
- Publish

4 MATLAB Tools

5 Code Performance

Data Types Functions and Scripts MATLAB Tools Code Performance

Basic Information

- Grading: Satisfactory/No credit
 - Satisfactory completion of assignments
- Lectures
 - Interactive demos
 - Bring laptop
- Assignments
 - Assigned each Thursday, due following Thursday
 - Problem sets will be rather lengthy
 - Only required to complete a *subset* of problems on each
 - Meant for you to pick problems relevant to you
 - Submit files via *Dropbox* on Coursework
 - Create zip file containing all code
 - Additional details given with problem sets
 - Project in lieu of assignments; requires instructor approval

Logistics Data Types ons and Scripts

Functions and Scripts MATLAB Tools Code Performance

Basic Information

- Very quick survey after first few classes
 - Keep class interesting and inline with your expectations
- Office Hours:
 - Tue/Thurs 5p 7p (after class) Durand 028
 - Additional office hours, if requested
 - Drop-in/by appointment Durand 028
- Course Homepage: http://web.stanford.edu/~mzahr/cme292.html
- Accessing MATLAB
 - See document on website (Pawin)
 - I recommend using MATLAB instead of an alternative
 - MATLAB isn't paying me to say this, I promise
- MATLAB Help
 - Very useful documentation: Use it!
 - doc, help
 - http://www.mathworks.com/help/

Data Types Functions and Scripts MATLAB Tools Code Performance

Syllabus

Lecture 1

- Fundamental MATLAB features, syntaxes, concepts
 - Data types
 - Functions/scripts, publishing
 - Debugger, profiler
 - Memory management

Lecture 2

- Graphics
 - Advanced Plotting Functions
 - Graphics objects and handles
 - Publication-quality graphics
 - MATLAB File Exchange

(http://www.mathworks.com/matlabcentral/fileexchange/)

- Animation
 - VideoWriter

Data Types Functions and Scripts MATLAB Tools Code Performance

Syllabus

Lecture 3

- Numerical linear algebra
 - Dense vs. sparse matrices
 - Direct vs. iterative linear system solvers
 - Matrix decompositions
 - LU, Cholesky, QR, EVD, SVD

- Numerical Optimization
 - Optimization Toolbox
- Nonlinear Systems of Equations

Data Types Functions and Scripts MATLAB Tools Code Performance

Syllabus

Lecture 5

- Object-oriented programming
 - User-defined classes

- File manipulation and system interaction
 - Text file manipulation
 - Binary file manipulation
 - System calls
 - Interfacing with spreadsheets (Excel)

Data Types Functions and Scripts MATLAB Tools Code Performance

Syllabus

Lecture 7

- Compiled MATLAB
 - Interface to low-level programming languages (C/C++/Fortran)
 - MEX Files
 - Standalone C/C++ code from MATLAB code
 - MATLAB Coder

- Symbolic Math Toolbox
- Parallel Computing Toolbox
- Numerical solution of ODEs and PDEs
 - Partial Differential Equation Toolbox

Data Types Functions and Scripts MATLAB Tools Code Performance

Syllabus

- Optional, no homeworks
- Up to you...
 - Additional depth on any of the covered topics
 - Additional topics

Data Types Functions and Scripts MATLAB Tools Code Performance

Introduction

- High-level language for technical computing
 - Integrates computation, visualization, and programming
 - Sophisticated data structures, editing and debugging tools, object-oriented programming
- MATrix LABoratory (MATLAB)
 - Highly optimized for matrix operations
 - Originally written to provide easy access to matrix software: LINPACK (linear system package) and EISPACK (eigen system package)
 - Basic element is array that does not require dimensioning
- Highly interactive, interpreted programming language
 - Development time usually significantly reduced compared to compiled languages
- *Very* useful graphical debugger

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Outline

1 Logistics

2 Data Types

- Numeric Arrays
- Cells & Cell Arrays
- Struct & Struct Arrays
- Function Handles

3 Functions and Scripts

- Function Types
- Workspace Control
- Inputs/Outputs
- Publish

4 MATLAB Tools

5 Code Performance

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Overview

- Numeric Data Types
 - single, double, int8, int16, int32, int64, uint8, uint16, uint32, uint64, NaN, Inf
- Characters and strings
- Tables
- Structures
- Cell Arrays
- Function Handles
- Map Containers

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Overview

- Fortran ordering (column-wise)
- Array creation
 - blkdiag, diag, eye, true/false, linspace/logspace, ones, rand, zeros
- Array concatenation
 - vertcat $([\cdot; \cdot])$, horzcat $([\cdot, \cdot])$
- Indexing/Slicing
 - Linear indexing
 - Indexing with arrays
 - Logical indexing
 - Colon operator, end keyword
- Reshaping/sorting
 - fliplr, flipud, repmat, reshape, squeeze, sort, sortrows
- Matrix vs. Elementwise Operations

Fortran Ordering

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

- MATLAB uses Fortran (column-wise) ordering of data
 - First dimension is fastest varying dimension

 $\begin{array}{c}
11\\
12\\
13\\
14\\
15\\
16\\
17\\
18\\
\end{array}$

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Linear Indexing

• Linear storage and Fortran ordering can be used to index into array with *single* index

```
>> M(1)
ans =
    11
>> M(8)
ans =
    18
>> M(5:8)
ans =
    15
          16
                 17
                       18
>> M([1,3,4,8])
ans =
          13
    11
                 14
                       18
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Indexing with Arrays

- Arrays can be used to index/slice into arrays
 - Result is an array of the same size as the index array
 - Works with linear indexing or component-wise indexing
 - Component-wise indexing with matrices is equivalent to component-wise indexing with vectorization of matrix

```
\gg M([1,3,4,8]) % Linear indexing (array)
ans =
         13 14
                      18
    11
>> M([1,5,2;8,3,2;7,4,6]) % Linear indexing (matrix)
ans =
    11
          15
                12
    18
          13
               12
    17
          14
                16
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Indexing with Arrays (continued)

```
>> M([1,2],[2,1],[2,1]) % Component indexing (array)
ans(:,:,1) =
    17
          15
    18
          16
ans(:,:,2) =
    13
          11
    14
         12
% Component-wise matrix indexing equivalent to
% component-wise indexing with vectorized matrix
>> isequal(M([2,2;2,1],[2,1],1),...
                      M(vec([2,2;2,1]), [2,1], 1))
ans =
     1
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Logical Indexing

- Index into array based on some *boolean* array
 - Match element in boolean array with those in original array one-to-one
 - If *i*th entry of boolean array true, *i*th entry of original array extracted
 - Useful in extracting information from an array conditional on the content of the array
- "Linear" and component-wise available
- Much quicker than using find and then vector indexing

```
>> P = rand(5000);
>> tic; for i = 1:10, P(P<0.5); end; toc
Elapsed time is 6.071476 seconds.
>> tic; for i = 1:10, P(find(P<0.5)); end; toc
Elapsed time is 9.003642 seconds.
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Logical Indexing (continued)

• Example

```
>> R = rand(5)
R =
   0.8147
             0.0975
                      0.1576
                               0.1419
                                         0.6557
   0.9058
             0.2785
                     0.9706
                               0.4218
                                         0.0357
   0.1270
             0.5469
                     0.9572
                               0.9157
                                         0.8491
   0.9134
            0.9575 0.4854
                               0.7922
                                         0.9340
   0.6324
             0.9649
                      0.8003
                               0.9595
                                         0.6787
>> R(R < 0.15) '
ans =
   0.1270
             0.0975
                      0.1419
                               0.0357
>> isequal(R(R < 0.15), R(find(R<0.15)))
ans =
    1
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Logical Indexing (Exercise)

```
% logical array assignment
x = linspace(0,2*pi,1000);
y = sin(2*x);
plot(x,y,'k-','linew',2); hold on;
```

- Run the above code in your MATLAB command window (or use logarray_assign.m)
- Plot only the values of y = sin(2*x) in the interval $[0, \pi/2]$ in 1 additional line of code
 - Use plot(. , ., 'r--', 'linew',2);
- Plot only the values of $\sin (2 \star x)$ in the set $\{x \in [0, 2\pi] | -0.5 < \sin(2x) < 0.5\}$ in 1 additional line of code
 - Use plot(. , ., 'b:','linew',2);

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Reshaping Arrays

Command	Description
<pre>reshape(X,[m n p])</pre>	Returns N -D matrix, size
	$m imes n imes p imes \cdots$
<pre>repmat(X,[m n p])</pre>	Tiles X along N dimensional
	specified number of times
fliplr(X)	Flip matrix in left/right direction
flipud(X)	Flip matrix in up/down direction
squeeze(X)	Remove singleton dimensions

• squeeze_ex.m

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Reshaping Arrays (continued)

• Example: reshape, repmat

```
>> N = rand(100,1);
>> size(reshape(N,...
[50,2]))
ans =
50 2
>> size(reshape(N,...
[25,2,2]))
ans =
25 2 2
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Reshaping Arrays (continued)

• Example: fliplr, flipud, squeeze

```
>> A = [1,2;3,4];
>> fliplr(A)
ans =
        2   1
        4   3
>> flipud(A)
ans =
        3   4
        1   2
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Matrix Operations

- MATLAB operations on numeric arrays are *matrix* operations
 - \bullet +, -, *, \, /,^, etc
- Prepend . for element-wise operations
 - .*, ./, .^, etc
- Expansion of singleton dimension not automatic
 - bsxfun(func, A, B)

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Create Cell Array and Access Data

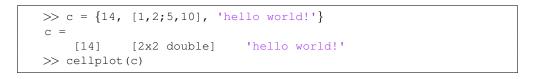

- Collection of data of any MATLAB type
- Additional flexibility over numeric array
 - Price of generality is storage efficiency
- Constructed with {} or cell
- Cell arrays are MATLAB arrays of *cell*
- Indexing
 - Cell *containers* indexed using ()
 - c(i) returns *i*th cell of cell array c
 - Cell *contents* indexed using {}
 - c{i} returns contents of *i*th cell of cell array c

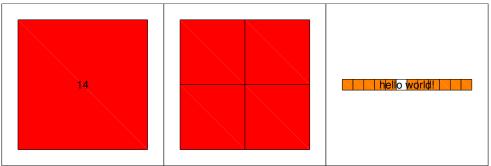

```
>> c = {14, [1,2;5,10], 'hello world!'};
>> class(c(2))
ans =
cell
>> class(c{2})
double
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Cellplot

Numeric Arrays **Cells & Cell Arrays** Struct & Struct Arrays Function Handles

Cell Array in For Loop

- Distinction between cell *container* and cell *contents* is important
- Previous example
 - Matrix operations on $c(2) \implies \text{Error}$
 - Matrix operations on c{2} are valid
- Another example: using cell array in for loop

>> for i = c, class(i), end

• What is displayed?

• cell

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Add and Delete Data

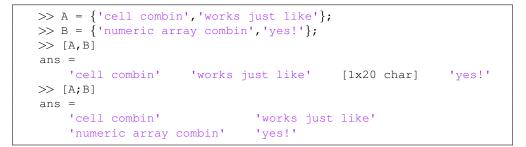

- Adding data to cell array
 - Create/access entry with {}
 - Assign contents of container with =
- Deleting data from cell array
 - Grab cell containers with ()
 - Delete containers by assigning the value []

Numeric Arrays **Cells & Cell Arrays** Struct & Struct Arrays Function Handles

Combine Cell Arrays

- Like numerical arrays, cell array can be combined into a single cell array
 - horzcat, $[\;\cdot\;,\;\cdot\;]$
 - vertcat, [\cdot ; \cdot]

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Comma-Separated Lists via Cell Arrays

• Comma-Separated List

- List of MATLAB objects separated by commas
- Each item displayed individually when printed
- Useful in passing arguments to functions and assigning output variables
- Can be generated using {:} operator in cell array

```
>> pstr={'bo-', 'linewidth',2, 'markerfacecolor', 'r'};
>> plot(1:10,pstr{:}) % Pass comma-sep list to func
```

Numeric Arrays **Cells & Cell Arrays** Struct & Struct Arrays Function Handles

Memory Requirements

- Cell arrays require additional memory to store information describing each cell
 - Information is stored in a *header*
 - Memory required for header of single cell

```
>> c = {[]}; s=whos('c'); s.bytes
ans =
60
```

- Memory required for cell array
 - (head_size x number_of_cells) + data
- Contents of a single cell stored contiguously
- Storage not necessarily contiguous between cells in array

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Functions

Command	Description
cell2mat	Convert cell array to numeric array
cell2struct	Convert cell array to structure array
cellfun	Apply function to each cell in cell array
cellstr	Create cell array of strings from character array
iscell	Determine whether input is cell array
iscellstr	Determine whether input is cell array of strings
mat2cell	Convert array to cell array
num2cell	Convert array to cell array
struct2cell	Convert structure to cell array

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Structures

- Like cell arrays, can hold arbitrary MATLAB data types
- Unlike cell arrays, each entry associated with a *field*
 - Field-Value relationship
- Structures can be arranged in N-D arrays: structure arrays
- Create structure arrays
 - struct
 - <var-name>.<field-name> = <field-value>
- Access data from structure array
 - () to access structure from array, . to access field

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Structures (continued)

- Concatenation of structures to form structure arrays
 - horzcat, $[\cdot, \cdot]$
 - vertcat, [\cdot ; \cdot]
- Nested structures
 - Create and access nested structure array with multiple () and . syntax

```
>> s(2).name(4).first='Your First Name';
>> s(2).name(4).last='Your Last Name'
s =
1x2 struct array with fields:
    name
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Dynamic Field Names

- Field names not necessarily known in advance
 - Generate field names during computation

```
>> s = struct();
>> for i=1:3, s.(['P',num2str(i)]) = i; end
>> s
s =
    P1: 1
    P2: 2
    P3: 3
```

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Memory Requirements

- Structure of arrays faster and more memory efficient than array of structures
 - Contiguous memory
 - Memory overhead

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Memory Requirements

- Structs require additional memory to store information
 - Information is stored in a *header*
 - Header for entire structure array
- Each field of a structure requires contiguous memory
- Storage not necessarily contiguous between fields in structure or structures in array
- Structure of arrays faster/cheaper than array of structures
 - Contiguous memory, Memory overhead

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Functions

Command	Description
fieldnames	Field names of structure
getfield	Field of structure array
isfield	Determine whether input is structure field
isstruct	Determine whether input is structure array
orderfields	Order fields of structure array
rmfield	Remove fields from structure
setfield	Assign values to structure array field
arrayfun	Apply function to each element of array
structfun	Apply function to each field of scalar structure

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Function Handles (@)

- Callable association to MATLAB function stored in variable
 - Enables invocation of function outside its normal scope
 - Invoke function indirectly
 - Variable
- Capture data for later use
- Enables passing functions as arguments
 - Optimization
 - Solution of nonlinear systems of equations
 - Solution of ODEs
 - Numerical Integration
- Function handles must be scalars, i.e. can't be indexed with ()

Numeric Arrays Cells & Cell Arrays Struct & Struct Arrays Function Handles

Example

• Trapezoidal rule for integration

$$\int_{a}^{b} f(x)dx \approx \sum_{i=1}^{n_{el}} \frac{b-a}{2n_{el}} \left[f(x_{i+1/2}) + f(x_{i-1/2}) \right]$$

function int_f = trap_rule(f,a,b,nel)

```
x=linspace(a,b,nel+1)';
int_f=0.5*((b-a)/nel)*sum(f(x(1:end-1))+f(x(2:end)));
```

end

Function Types Inputs/Outputs

Outline

1 Logistics

2 Data Types

- Numeric Arrays
- Cells & Cell Arrays
- Struct & Struct Arrays
- Function Handles

3 Functions and Scripts

- Function Types
- Workspace Control
- Inputs/Outputs
- Publish

4 MATLAB Tools

5 Code Performance

Function Types Inputs/Outputs

Scripts vs. Functions

• Scripts

- Execute a series of MATLAB statements
- Uses *base* workspace (does not have own workspace)
- Parsed and loaded into memory every execution
- Functions
 - Accept inputs, execute a series of MATLAB statements, and return outputs
 - Local workspace defined only during execution of function
 - global, persistent variables
 - evalin, assignin commands
 - Local, nested, private, anonymous, class methods
 - Parsed and loaded into memory during *first* execution

Function Types Inputs/Outputs

Anonymous Functions

- Functions without a file
 - Stored directly in function handle
 - Store expression and required variables
 - Zero or more arguments allowed
 - Nested anonymous functions permitted
- Array of function handle not allowed; function handle may return array

```
>> f1 = @(x,y) [sin(pi*x), cos(pi*y), tan(pi*x*y)];
>> f1(0.5,0.25)
ans =
    1.0000   0.7071   0.4142
>> quad(@(x) exp(1)*x.^2,-1,1)
ans =
    1.8122
```

Function Types Inputs/Outputs

Local Functions

- A given MATLAB file can contain multiple functions
 - The first function is the *main* function
 - Callable from anywhere, provided it is in the search path
 - Other functions in file are *local* functions
 - Only callable from main function or other local functions in *same* file
 - Enables modularity (large number of small functions) without creating a large number of files
 - Unfavorable from code reusability standpoint

Function Types Inputs/Outputs

Local Function Example

Contents of loc_func_ex.m

```
function main_out = loc_func_ex()
main_out = ['I can call the ',loc_func()];
end
function loc_out = loc_func()
loc_out = 'local function';
end
```

Command-line

```
>> loc_func_ex()
ans =
I can call the local function
>> ['I can''t call the ',loc_func()]
??? Undefined function or variable 'loc_func'.
```

Nested Functions

- A *nested function* is a function *completely* contained within some parent function.
- Useful as an alternative to *anonymous* function that can't be confined to a single line
- Can't be defined within MATLAB control statements
 - if/elseif/else, switch/case, for, while, or try/catch
- Variables *sharable* between parent and nested functions
- If variable in nested function not used in parent function, it remains local to the nested function
- Multiple levels of nesting permitted
 - Nested function available from
 - Level immediately above
 - Function nested at same level with same parent
 - Function at any lower level

Function Types Inputs/Outputs

Nested Functions: Example

• Parent and nested function can share variables

```
function nested_ex1
x = 5;
nestfun1;
function nestfun1
    x = x + 1;
end
function nestfun2
    y = 4;
end
disp(x) % x = 6
nestfun2
disp(y+1) % y = 5
end
```

Function Types Inputs/Outputs

Private Functions

- Private functions useful for limiting scope of a function
- Designate a function as private by storing it in a subfolder named *private*
- Only available to functions/scripts in the folder immediately above the private subfolder

Function Types Inputs/Outputs

Evaluate/Assign in Another Workspace

- Eval expression in other workspace ('caller', 'base')
 - evalin(ws, *expression*)
 - Useful for evaluating expression in caller's workspace *without* passing name variables as function arguments
- Assign variable in other workspace ('caller', 'base')
 - assignin(ws, 'var', val)
 - Useful for circumventing local scope restrictions of functions

Variable Number of Inputs/Outputs

- Query number of inputs passed to a function
 - nargin
 - Don't try to pass more than in function declaration
- Determine number of outputs requested from function
 - nargout
 - Don't request more than in function declaration

```
function [01,02,03] = narginout_ex(i1,i2,i3)
fprintf('Number inputs = %i;\t',nargin);
fprintf('Number outputs = %i;\n',nargout);
o1 = i1; o2=i2; o3=i3;
end
```

```
>> narginout_ex(1,2,3);
Number inputs = 3; Number outputs = 0;
>> [a,b]=narginout_ex(1,2,3);
Number inputs = 3; Number outputs = 2;
```

Variable-Length Input/Output Argument List

- Input-output argument list length unknown or conditional
 - Think of plot, get, set and the various Name-Property pairs that can be specified in a given function call
- Use varargin as last function input and varargout as last function output for input/output argument lists to be of variable length
- All arguments prior to varargin/varargout will be matched one-to-one with calling expression
- Remaining input/outputs will be stored in a cell array named varargin/varargout
- help varargin, help varargout for more information

Function Types Inputs/Outputs

varargin, varargout $\operatorname{Example}$

```
function [b, varargout] = vararg_ex(a, varargin)
1
2
3 b = a^2;
 class(varargin)
4
  varargout = cell(length(varargin)-a,1);
5
  [varargout{:}] = varargin{1:end-a};
6
7
8
  end
  >> [b, vo1, vo2] = ...
      vararg_ex(2, 'varargin', 'varargout', 'example', '!');
  ans =
  cell
  vo1 =
  varargin
  vo2 =
  varargout
```

Function Types Inputs/Outputs

Publishing Scripts and Functions

- Generate view of MATLAB file in specified format
 - publish(file, format)
- Generate view of MATLAB file, fine-grained control
 - publish(file,Name,Value), publish(file,options)
- By default, publishing MATLAB file runs associated code
 - Problematic when publishing functions
 - Set 'evalCode' to false
 - $\bullet~{\rm File} \rightarrow {\rm Publish}$ Configuration for <filename>

Outline

1 Logistics

2 Data Types

- Numeric Arrays
- Cells & Cell Arrays
- Struct & Struct Arrays
- Function Handles

3 Functions and Scripts

- Function Types
- Workspace Control
- Inputs/Outputs
- Publish

4 MATLAB Tools

5 Code Performance

Debugger

- Breakpoint
- Step, Step In, Step Out
- Continue
- Tips/Tricks
 - Very useful!
 - Error occurs only on 10031 iteration. How to debug?
 - Conditional breakpoints
 - Try/catch
 - If statements

Profiler

- Debug and optimize MATLAB code by tracking execution time
 - Itemized timing of individual functions
 - Itemized timing of individual lines within each function
 - Records information about execution time, number of function calls, function dependencies
 - Debugging tool, understand unfamiliar file
- profile (on, off, viewer, clear, -timer)
- profsave
 - Save profile report to HTML format
- Demo: nltruss.m
- Other performance assessment functions
 - tic, toc, timeit, bench, cputime
 - memory

Outline

- Numeric Arrays
- Cells & Cell Arrays
- Struct & Struct Arrays
- Function Handles

3 Functions and Scripts

- Function Types
- Workspace Control
- Inputs/Outputs
- Publish

4 MATLAB Tools

5 Code Performance

Performance Optimization

- Optimize the algorithm itself
- Be careful with matrices!
 - Sparse vs. full
 - Parentheses
 - A*B*C*v
 - A*(B*(C*v))
- Order of arrays matters
 - Fortran ordering
- Vectorization
 - MATLAB highly optimized for array operations
 - Whenever possible, loops should be re-written using arrays
- Memory management
 - Preallocation of arrays
 - Delayed copy
 - Contiguous memory

Order of Arrays

- Due to Fortran ordering, indexing column-wise is much faster than indexing row-wise
 - Contiguous memory

```
mat = ones(1000, 1000); n = 1e6;
tic();
for i=1:n, vec = mat(1,:); end
toc()
tic();
for i=1:n, vec = mat(:,1); end
toc()
```

Vectorization

Toy Example

i = 0; for t = 0:.01:10 i = i + 1; y(i) = sin(t); end

Vectorized

y = sin(0:.01:10);

Slightly less toy example

n = 100; M = magic(n); v = M(:,1); for i = 1:n M(:,i) = ... M(:,i) - v end

Vectorized

n=100; M = magic(n); v = M(:,1); M=bsxfun(@minus,M,v);

Memory Management Functions

Command	Description
clear	Remove items from workspace
pack	Consolidate workspace memory
save	Save workspace variables to file
load	Load variables from file into workspace
inmem	Names of funcs, MEX-files, classes in memory
memory	Display memory information
whos	List variables in workspace, sizes and types

Delayed Copy

- When MATLAB arrays passed to a function, only copied to local workspace when it is *modified*
- Otherwise, entries accessed based on original location in memory

```
1 function b = delayed_copy_ex1(A)
2 b = 10*A(1,1);
3 end
```

```
1 function b = delayed_copy_ex2(A)
2 A(1,1) = 5; b = 10*A(1,1);
3 end
```

```
>> A = rand(10000);
>> tic; b=delayed_copy_ex1(A); toc
Elapsed time is 0.000083 seconds.
>> tic; b=delayed_copy_ex2(A); toc
Elapsed time is 0.794531 seconds.
```

Delayed Copy

```
1 function b = delayed_copy_ex3(A)
2 b = 10*A(1,1); disp(A); A(1,1) = 5; disp(A);
3 end
```

```
>> format debug
>> A = rand(2);
>> disp(A) % Output pruned for brevity
pr = 39cd3220
>> delayed_copy_ex3(A); % Output pruned for brevity
pr = 39cd3220
pr = 3af96320
```

Contiguous Memory and Preallocation

- Contiguous memory
 - Numeric arrays are *always* stored in a contiguous block of memory
 - Cell arrays and structure arrays are not necessarily stored contiguously
 - The contents of a given cell or structure *are* stored contiguously
- Preallocation of contiguous data structures
 - Data structures stored as contiguous blocks of data should be preallocated instead of incrementally grown (i.e. in a loop)
 - Each size increment of such a data type requires:
 - $\bullet\,$ Location of new contiguous block of memory able to store new object
 - Copying original object to new memory location
 - Writing new data to new memory location
